

ΛΥΣΕΙΣ ΑΣΚΗΣΕΩΝ 1-13

1. Δίνεται η συνάρτηση $f(x) = \begin{cases} 3x - 5, & \text{αν } 1 < x \leq 2 \\ x - 1, & \text{αν } 2 < x < 4 \\ 3, & \text{αν } 4 \leq x < 6 \end{cases}$. Να βρείτε ποια από τα παρακάτω ολοκληρώματα ορίζονται:
- a) $\int_1^2 f(x) dx$. d) $\int_3^5 f(\omega) d\omega$. ε) $\int_6^6 f(t) dt$
b) $\int_3^2 f(x) dx$. e) $\int_0^2 f(t) dt$.
c) $\int_3^4 f(u) du \cdot \int_3^5 f(v) dv$.

Λύση:

$$\left. \begin{aligned} \lim_{x \rightarrow 2^-} f(x) &= \lim_{x \rightarrow 2^-} (3x - 5) = 1 \\ \lim_{x \rightarrow 2^+} f(x) &= \lim_{x \rightarrow 2^+} (x - 1) = 1 \end{aligned} \right\} \Rightarrow \lim_{x \rightarrow 2} f(x) = 1 = f(2). \text{ Άρα η } f \text{ είναι συνεχής στο } 2.$$

$$\left. \begin{aligned} \lim_{x \rightarrow 4^-} f(x) &= \lim_{x \rightarrow 4^-} (x - 1) = 3 \\ \lim_{x \rightarrow 4^+} f(x) &= \lim_{x \rightarrow 4^+} (3) = 3 \end{aligned} \right\} \Rightarrow \lim_{x \rightarrow 4} f(x) = 3 = f(4). \text{ Άρα η } f \text{ είναι συνεχής στο } 4.$$

- a) Στο διάστημα $[1,2]$ δεν είναι συνεχής γιατί $1 \notin D_f$. Επομένως δεν ορίζεται το $\int_1^2 f(x) dx$.
b) Στο διάστημα $[2,3]$ είναι συνεχής. Επομένως ορίζεται το $\int_3^2 f(x) dx$.
c) Στο διάστημα $[3,5]$ είναι συνεχής. Επομένως ορίζεται το $\int_3^4 f(u) du \cdot \int_3^5 f(v) dv$.
d) Ομοίως.
e) Το διάστημα $[0,2]$ δεν είναι υποσύνολο του πεδίου ορισμού D_f . Επομένως δεν ορίζεται το $\int_0^2 f(t) dt$
f) Το $\int_6^6 f(t) dt$ δεν ορίζεται, γιατί $6 \notin D_f$.

2. α) Να δείξετε ότι $\int_0^{\pi/2} \eta \mu^v x dx = \int_0^{\pi/2} \sigma \nu v^v x dx$, για κάθε $v \in \mathbb{N}^*$.
β) Να δείξετε ότι $\int_0^{\pi/2} \eta \mu^2 x dx = \int_0^{\pi/2} \sigma \nu v^2 x dx = \frac{\pi}{4}$.

Λύση: α) $\int_0^{\pi/2} \eta \mu^v x dx = - \int_{\pi/2}^0 \eta \mu^v \left(\frac{\pi}{2} - y \right) dy = \int_0^{\pi/2} \sigma \nu v^v y dy = \int_0^{\pi/2} \sigma \nu v^v x dx$.

Θέτω $x = \frac{\pi}{2} - y$.
 $dx = -dy$ και
όταν $x=0 \Rightarrow y = \frac{\pi}{2}$
όταν $x = \frac{\pi}{2} \Rightarrow y=0$

β) Από (α) ερώτημα για $v=2$ έχουμε $\int_0^{\pi/2} \eta \mu^2 x dx = \int_0^{\pi/2} \sigma \nu v^2 x dx$.

Επίσης $\int_0^{\pi/2} \eta \mu^2 x dx + \int_0^{\pi/2} \sigma \nu v^2 x dx = \int_0^{\pi/2} (\eta \mu^2 x + \sigma \nu v^2 x) dx = \int_0^{\pi/2} 1 dx = [x]_0^{\pi/2} = \frac{\pi}{2}$.

$$\Rightarrow \int_0^{\pi/2} \eta \mu^2 x dx = \int_0^{\pi/2} \sigma \nu v^2 x dx = \frac{\pi}{4}.$$

3. Να δείξετε ότι $\int_{-2}^2 \frac{e^x - e^{-x}}{x^2 + 1} dx = 0$.

Λύση: Έστω $f(x) = \frac{e^x - e^{-x}}{x^2 + 1}$. Έχει πεδίο ορισμού το \mathbb{R} και $f(-x) = \frac{e^{-x} - e^{-(-x)}}{(-x)^2 + 1} = \frac{e^{-x} - e^x}{x^2 + 1}$
 $= -\frac{e^x - e^{-x}}{x^2 + 1} = -f(x)$ για κάθε $x \in \mathbb{R}$. Άρα η συνάρτηση είναι περιττή και επομένως $\int_{-2}^2 \frac{e^x - e^{-x}}{x^2 + 1} dx = 0$.

$$4. \text{ Υπολογίστε το } \int_{-1}^1 |x| dx.$$

Λύση: Επειδή η συνάρτηση $f(x)=|x|$, $x \in [-1,1]$ είναι άρτια, γιατί $f(-x) = |-x| = |x| = f(x)$ για κάθε $x \in [-1,1]$,

$$\text{θα είναι } \int_{-1}^1 |x| dx = 2 \int_0^1 |x| dx = 2 \int_0^1 x dx = [x^2]_0^1 = 1.$$

$$5. \text{ Να δείξετε ότι } \int_{\pi}^{5\pi/4} \frac{\eta\mu 2\chi}{\sigma\upsilon\nu^2 \chi} d\chi = \int_0^{\pi/4} \frac{\eta\mu 2\chi}{\sigma\upsilon\nu^2 \chi} d\chi.$$

Λύση: Επειδή η συνάρτηση $f(x) = \frac{\eta\mu 2x}{\sigma\upsilon\nu^2 x}$ είναι περιοδική με περίοδο $T=\pi$, γιατί $f(x+\pi) = \frac{\eta\mu 2(x+\pi)}{\sigma\upsilon\nu^2(x+\pi)} =$

$$= \frac{\eta\mu(2x+2\pi)}{(\sigma\upsilon\nu x)^2} = \frac{\eta\mu 2x}{\sigma\upsilon\nu^2 x} = f(x), \text{ για κάθε } x \in \mathbb{R}, \text{ θα είναι } \int_0^{\pi/4} \frac{\eta\mu 2\chi}{\sigma\upsilon\nu^2 \chi} d\chi = \int_{0+\frac{\pi}{4}}^{\pi+\frac{\pi}{4}} \frac{\eta\mu 2\chi}{\sigma\upsilon\nu^2 \chi} d\chi = \int_{\pi}^{5\pi/4} \frac{\eta\mu 2\chi}{\sigma\upsilon\nu^2 \chi} d\chi.$$

$$6. \text{ Να δείξετε ότι } \int_0^1 \sqrt{x} dx \geq \int_0^1 x^3 dx.$$

Λύση: Αρκεί να δείξουμε ότι $\sqrt{x} \geq x^3$, για κάθε $0 \leq x \leq 1$, ή ισοδύναμα $x \geq x^6 \Leftrightarrow x - x^6 \geq 0 \Leftrightarrow x(1-x^5) \geq 0$ αληθής γιατί $0 \leq x \leq 1$.

$$7. \text{ Να δείξετε ότι } \left| \int_0^{\frac{\pi}{2}} \frac{\eta\mu x}{x^2+1} dx \right| \leq \int_0^{\frac{\pi}{2}} \frac{1}{x^2+1} dx.$$

$$\text{Λύση: } \left| \int_0^{\frac{\pi}{2}} \frac{\eta\mu x}{x^2+1} dx \right| \leq \int_0^{\frac{\pi}{2}} \left| \frac{\eta\mu x}{x^2+1} \right| dx = \int_0^{\frac{\pi}{2}} \frac{|\eta\mu x|}{|x^2+1|} dx \leq \int_0^{\frac{\pi}{2}} \frac{1}{x^2+1} dx.$$

$$8. \text{ Να δείξετε ότι } \frac{\sqrt{3}}{8} \leq \int_{\pi/4}^{\pi/3} \frac{\eta\mu x}{x} dx \leq \frac{\sqrt{2}}{6}.$$

Λύση: Έστω $f(x) = \frac{\eta\mu x}{x}$, $x \in \left[\frac{\pi}{4}, \frac{\pi}{3} \right]$.

$$\text{Τότε } f'(x) = \frac{x\sigma\upsilon\nu x - \eta\mu x}{x^2} \dots\dots\dots(1)$$

Θεωρώ την συνάρτηση $g(x) = x\sigma\upsilon\nu x - \eta\mu x$.

$$g'(x) = \sigma\upsilon\nu x - x\chi\eta\mu x - \sigma\upsilon\nu x = -x\chi\eta\mu x < 0 \text{ στο } \left[\frac{\pi}{4}, \frac{\pi}{3} \right].$$

$$\text{Άρα } g \searrow \text{ στο } \left[\frac{\pi}{4}, \frac{\pi}{3} \right] \text{ και } \frac{\pi}{4} \leq x \leq \frac{\pi}{3} \Leftrightarrow g\left(\frac{\pi}{3}\right) \leq g(x) \leq g\left(\frac{\pi}{4}\right) \Leftrightarrow \frac{\pi - 3\sqrt{3}}{6} \leq x\sigma\upsilon\nu x - \eta\mu x \leq \frac{\sqrt{2}(\pi - 4)}{8}.$$

Επομένως $x\sigma\upsilon\nu x - \eta\mu x < 0$ στο $\left[\frac{\pi}{4}, \frac{\pi}{3} \right]$.

$$(1) \Rightarrow f'(x) < 0 \Rightarrow f \searrow \text{ στο } \left[\frac{\pi}{4}, \frac{\pi}{3} \right] \text{ και για } \frac{\pi}{4} \leq x \leq \frac{\pi}{3} \text{ ισχύει } f\left(\frac{\pi}{3}\right) \leq f(x) \leq f\left(\frac{\pi}{4}\right) \Leftrightarrow \frac{3\sqrt{3}}{2\pi} \leq f(x) \leq \frac{2\sqrt{2}}{\pi}.$$

Επομένως η f έχει ελάχιστη τιμή $m = \frac{3\sqrt{3}}{2\pi}$ και μέγιστη τιμή $M = \frac{2\sqrt{2}}{\pi}$ στο $\left[\frac{\pi}{4}, \frac{\pi}{3} \right]$.

Εφαρμόζοντας την σχέση $m(\beta - \alpha) \leq \int_{\alpha}^{\beta} f(x)dx \leq M(\beta - \alpha)$ βρίσκουμε $\frac{\sqrt{3}}{8} \leq \int_{\pi/4}^{\pi/3} \frac{\eta\mu x}{x} dx \leq \frac{\sqrt{2}}{6}$.

9. Να δείξετε ότι $\int_2^5 \frac{1}{x^2+1} dx \leq \int_2^5 \frac{x}{10} dx$.

Λύση: Αρκεί να δείξουμε ότι $\frac{1}{x^2+1} \leq \frac{x}{10}$ ή $x^3+x-10 \geq 0$ στο διάστημα $[2,5]$.

Η συνάρτηση $f(x)=x^3+x-10$ είναι \nearrow στο $[2,5]$ γιατί $f'(x)=3x^2+1 > 0$.

Η f έχει προφανή ρίζα το 2 και για $x \geq 2 \Rightarrow f(x) \geq f(2) \Rightarrow f(x) \geq 0 \Rightarrow x^3+x-10 \geq 0$ στο διάστημα $[2,5]$.

10. α) Να βρείτε το σύνολο τιμών της συνάρτησης $f(x)=e^{x^2-x}$, $x \in [0,2]$.

β) Να αποδείξετε ότι $\frac{2}{\sqrt[4]{e}} \leq \int_0^2 e^{x^2-x} dx \leq 2e^2$.

Λύση: Έστω $f(x)=e^{x^2-x}$, $x \in [0,2]$.

$$f'(x) = e^{x^2-x} (2x-1).$$

$$f'(x) = 0 \Leftrightarrow x = \frac{1}{2} \text{ γιατί } e^{x^2-x} > 0.$$

x	0	1/2	2
f'(x)	-	+	
f(x)	\searrow	\nearrow	

$$\text{Άρα } f([0, \frac{1}{2}]) = [f(\frac{1}{2}), f(0)] = \left[\frac{1}{\sqrt[4]{e}}, 1 \right] \text{ και } f([\frac{1}{2}, 2]) = [f(\frac{1}{2}), f(2)] = \left[\frac{1}{\sqrt[4]{e}}, e^2 \right].$$

$$\text{Επομένως } f([0, 2]) = \left[\frac{1}{\sqrt[4]{e}}, 1 \right] \cup \left[\frac{1}{\sqrt[4]{e}}, e^2 \right] = \left[\frac{1}{\sqrt[4]{e}}, e^2 \right].$$

$$\text{Άρα } m = \frac{1}{\sqrt[4]{e}} \text{ και } M = e^2.$$

Εφαρμόζοντας την σχέση $m(\beta - \alpha) \leq \int_{\alpha}^{\beta} f(x)dx \leq M(\beta - \alpha)$ βρίσκουμε $\frac{2}{\sqrt[4]{e}} \leq \int_0^2 e^{x^2-x} dx \leq 2e^2$.

11.3. $\int_1^e \frac{1 - \ln x}{x^2} dx$

Λύση:

$$\mathbf{11.1.} \int_0^1 2^x e^x dx = \int_0^1 (2e)^x dx = \left[\frac{(2e)^x}{\ln 2e} \right]_0^1 = \dots = \frac{2e-1}{\ln 2e}.$$
